Asayama M., Suzuki A., Nozawa S., Yamada A., Tanaka K., Takahashi H., Aida T., Shirai M.;
"A new sigma factor homolog in a cyanobacterium: cloning, sequencing, and light-responsive transcripts of rpop2 from Microcystis aeruginosa K-81.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Biochim. Biophys. Acta 1351:31-36 (1997).

-!- FUNCTION: THE SIGMA PACTOR IS AN INITIATION FACTOR THAT PROMOTES ATTACHMENT OF THE RAM POLYMERASE TO SPECIFIC INITIATION SITES AND THEN IS RELEASED (BY SIMILARITY).

-!- SIMILARITY: BELONGS TO THE SIGMA-70 FACTOR FAMILY.

This invention describes a novel method of desensitizing a patient to a polypeptide allergen and comprises administaring to the patient a peptide derived from the allergen where restriction to a MHC Class II molecule possessed by the patient can be demonstrated for the peptide and the possessed by the patient can be demonstrated for the peptide and the possesses the MHC Class II molecule. The methods can be used for desensitising patients to allergens present in e.g. grass, tree and weed including rapeed) pollens, fungi and moulds, setinging insects, the chiromidae (non-biting midges), spiders and mites, housefly, fruit fly, sheep blow fly, screw worm fly, grain weevil, silkworm, honeybe, non-biting midge larvae, meamples such as cat, dog, horse, cow, pig, sheep, rabbit, rat, guinea pig, mice or gerbil. They can also be used to produce immunological vaccines which may be used to prevent and/or treat conditions involving hypersensitivity to allergens. This sequence

The invention relates to a novel method for desensitising an individual to a selected polypeptide antigen. The method comprises administering a geomognition that contains polypeptide antigens in an amount that generates in the individual a state of hyporesponsiveness to the antigen to allow desensitisation to one or more polypeptide antigens. The method of the invention has immunomodulator activity, and may have a use in gene therapy. The composition and method are useful in manufacturing a medicament for desensitising an individual to a selected polypeptide to the antigen to allow desensitisation to one or more polypeptide antigens. The present sequence is used in the exemplification of the

This invention describes a novel method of desensitizing a patient to a polypeptide allergen and comprises administering to the patient a peptide derived from the allergen where restriction to a MHG Class II molecule possessed by the patient can be demonstrated for the peptide and the peptide is able to induce a late phase response in an individual who possesses the MHG Class II molecule. The methods can be used for desensitising patients to allergens present in e.g. grass, tree and weed (including ragweed) pollers, fungi and moulds, foods, stinging insects, the chiromidae (non-biting midges), spiders and mites, housefly, fruit first sheep blow fly, screw worm fly, grain weevil, silkworm, honeybee, non-biting midge larvae, bee moth larvae, mealworm, cockroach, larvae of Tenibrio molitor beetle, mammals such as cat, dog, horse, cow, pig, sheep, rabbit, rat, guinea pig, mice or gerbil. They can also be used to produce immunological vaccines which may be used to prevent and/or treat conditions involving hypersensitivity to allergens. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel method for desensitising an individual to a selected polypeptide antigen. The method comprises administering a geomposition that contains polypeptide antigens in a manut that generates in the individual a state of hyporesponsiveness to the antigen to allow desensitisation to one or more polypeptide antigens. The method of the invention has immunomodulator activity, and may have a use in genetherapy. The composition and method are useful in manufacturing a medicament for desensitising an individual to a selected polypeptide antigen or for generating in the individual a state of hyporesponsiveness antigen and allow desensitisation to one or more polypeptide antigens. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

the 6113 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid, (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway capathed for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for that the test compound that inhibits proliferation of an pathway in which a proliferation required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound, a activity; (11) a culture compitaing strains in which the gene or product is oversyptessed; (2) product is oversyptessed; (2) determining the extent of product is oversyptessed; (2) antipolar or the gene or the compound, and the cert compound that inhibits proliferation of an compound, a activity; (11) a culture compitaing strains in which the gene or which the cert compound that inhibits proliferation of an compound, a activity; (11) a culture compitaing strains in which the gene or which the cert compound is activity; (11) a culture compitaing strains in which need to compound the certain in a processor or underexpressed; (12) determining an antipolicic.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to which each of the strains is present in a culture or collection of strains, or (13) identifying is present in a culture or collection of strains, or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational ford discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the carification
                                                                                                                                                                                                                           Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Zyskind JW;
Xu HH;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ohlsen KL,

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical days. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The present invention describes polypeptides (1), designated POLYX
Dolypeptides (e.g. POLY1, POLY2, etc.), and the polymclectide sequences
(II) encoding them. POLY1-4 are members of the gamma aminobutyric acid
(GABA) receptor family; POLY5-8 are members of the epidermal growth
factor (EGP) family; POLY5-11 are members of the complement receptor
family; POLY12 is a member of the haematopoietic stem and progenitor cell
(HSPC) family; POLY13 is a member of the sulphorransferase family; POLY12 is a member of the sulphorransferase family; POLY12 is a member of the sulphorransferase family; POLY14

The seament of the syntaxin family; and POLY17 is a member of the
cerebroprotective, antiparkinsonian, nootropic, relaxant, anticonvulsant,
neuroleptic, neuroprotective, antialcoholic, cardiant, tranquilliser and
neuroleptic, neuroprotective, antialcoholic, cardiant, tranquilliser and
neuroleptic, neuroprotective, antialcoholic, cardiant, tranquilliser and
neuroleptic, neuroprotective, antialcoholic, cardiant, tranquilliser and
neuroleptic, neuroprotective, antialcoholic, cardiant, tranquilliser and
neuroleptic, neuroprotective, antialcoholic, cardiant, tranquilliser and
neuroleptic, neuroprotective, antialcoholic, cardiant, tranquilliser and
neuroleptic, neuroprotective, antialcoholic, cardiant, tranduilliser and
neuroleptic, neuroprotective, antialcoholic, cardiant, tranduilliser and
neuroleptic, neuroprotective, antialcoholic, cardiant and
preventing a POLYX-associated disorder in humans as a therapeutic in the
numan disease selected from a PoLYX-associated disorder, for treating or
pathological state in a mammal, especially patients suffering from, e.g.,
psychiatric and medican enclosed persons, succeptic and medican encourage tensors,
and member tensors, epideptic syndrome, amyotrophic lateral
ardiomyopathy and arrhythmogenic activity and memory functions,
cardiomyopathy and arrhythmogenic activity and memory functions,
present sequence represents POLY15
                  states, e.g., depression, stroke, Parkinson's disease, Huntington's disease, Tourette's syndrome, amyotrophic lateral sclerosis, head trauma, and Alzheimer's.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   71 ---LAMRNIEARG------LKOMKRQGDANVKGEE-----GIVKAHL--LIGVHDDIVS 113

                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes polypeptides (I), designated POLYX (II) encoding them. POLYI, POLY2,etc.), and the polymucleotide sequences (II) encoding them. POLYI-4 are members of the epidermal growth (GABA) receptor family; POLYI-8 are members of the epidermal growth catour (EGF) family; POLYI-1 are members of the complement receptor family; POLYI-2 is a member of the haematopoietic stem and progenitor cell (HSPC) family; POLYI-3 is a member of the sulphotransferase family; POLYI-4 care members of the sulphotransferase family; POLYI-4 care members of the syntaxin family; and POLYI-7 is a member of the probabitin family. [I) and (II) can have antidepressant, anticonvulsant, cerebroprotective, antiparkinsonian, mostropic, relaxant, anticonvulsant, neuroleptic, neuroprotective, antialcoholic, cardiant, tranquilliser and antiarrhythmic activities. (I) and (II) can be used for treating or preventing a POLYX-associated disorder in humans as a therapeutic in the construct of a medicament for treating a syndrome associated with a human disease selected from a POLYX-associated disorder, for treating a copychiatric and medical conditions, depression, stroke, Parkinson's disease, Huntington's disease, Tourette's syndrome, amyotrophic lateral conditions, disease, alcoholism, vigilance, anxiety, muscle tension, epileptogenic activity and memory functions, cardiomyopathy and arrhythmogenic right ventricular dysplasia. The present sequence represents POLY14, which was identified on chromosome I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           10;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes polypeptides (I), designated POLYX polypeptides (e.g. POLY1, POLY2,etc.), and the polynucleotide sequences (II) encoding them. POLY1.4 are members of the gamma aminobutyric acid (GABA) receptor family; POLY3 are members of the epidermal growth factor (EGF) family; POLY9-11 are members of the complement receptor family; POLY12 is a member of the haematopoietic stem and progenitor cell (HSPC) family; POLY13 is a member of the sulphotransferase family; POLY14 are members of the syntaxin family; and POLY17 is a member of the prohibitin family. (I) and (II) can have antidepressant,
New isolated polypeptides for treating a broad range of pathological states, e.g., depression, stroke, Parkinson's disease, Huntington's disease, Tourette's syndrome, amyotrophic lateral sclerosis, head trauma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Shimkets RA, Majumder K;

une invention describes an isolated *Volifs, (*Polifs, dipolypeptides and isolated *Volifs, polifs polify polypeptides (Septedially Polifs, polifs dipolification than the polification of preventing a pathology associated with human disease. Polifs polypeptide is also useful for identifying an agent that disease. Polifs polypeptide is also useful for identifying an agent that condition to Polification of the polypeptide. Intreatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. [III) is consetul for treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. [III) is consetul for treatment of a pathology related to aberrant the presence or amount of Polifications of decermining the presence or amount of Polifications of decermining to proteins) are useful for the treatment of psychiatric and medical conditions, depression, stroke, Parkinson's disease, Huntington's and conditions, depression, stroke, Parkinson's disease, Huntington's disease, Tourette's syndrome, amyotrophic lateral solerosis, head trauma, arrhythmogenic right ventricular displance, anxiety, muscle tension, carrythmogenic right ventricular displance, anxiety, muscle tension, carrythmogenic right ventricular displance, anxiety, muscle tension, carrythmogenic right ventricular displance, polification carding catrivity and memory functions, cardiomyopathy and arrhythmogenic right ventricular displance, polific treating carriors, enally care for treatment of learners. Folification may be useful for treatment of learners of progenitor cell like protein) may be useful for treatment of cancers. Cells comprished, and developmental disorders. Polification mysathenic syndrome, asteming of treatment of cancers. Cells comprished, and bolification and acute myeloid leukaemia, and bolification and acute myeloid leukaemia, and bolification and soute myeloid leukaemia, and bolification and soute myeloid leukaemia, and bolification and soute myeloid acute in activity o

cc expression or physiological interactions of the polypeptide. (III) is useful for treating a pathological state in a mammal and for determining constitutions of amount of Polixia a sample. Polixia (GABA receptor-like proteins) are useful for the treatment of psychiatric and medical conditions, depression, stroke, Parkinson's disease, Huntington's conditions, depression, stroke, Parkinson's disease, Huntington's conditions, depression, syndrome, amyotrophic lateral sclerosis, head trauma, Alzheimer's disease, alcoholism, vigilance, anxiety, muscle tension, epileptogenic activity and amenory functions, cardiomyopathy and contribute proteins) may be useful for treating cancer, aberrant anglogenesis, renal disease and diabetes. PoLY12 (Anamatopoietic stem and progenitor cell like protein) may be useful for treatment of leukaemia, contraind cirrhosis, cholangitis, hepatitis, ulcers, hyperthyroidism and developmental disorders. PoLY14-16 (Syntaxin-like proteins) may be useful for treatment of Lamberr-Baton myasthenic syndrome, asthma, myxoid liposarcoma and acute myeloid leukaemia, and PoLY 18 may be useful in treatment of Lamberr-Baton myasthenic syndrome, asthma, myxoid liposarcoma and acute myeloid leukaemia, and PoLY 18 may be useful in treatment of cancers. Cells comprising (I) are useful for producing nontreatment of cancers. Cells comprising (I) are useful for producing on and/or activity of PoLYX protein activity. This is the amino acid sequence of a novel human protein 10; 114 MEYDLAYKLGDLHPTTHVISDIQDFVVALSLEISDEG----NITMTSFEVRQFANVVNHI 169 71 ---LAMRNIEARG-----LKOMKROGDANVKGEE-----GIVKAHL--LIGVHDDIVS 113 162 CKTFILROLEVAGKEMSBEDVNDMLHÖGKWEVFNESLLTEINITKAQLSEIEQRHKELVN 221 Gamma-aminobutyic acid receptor-like protein; depression; stroke; GABA receptor-like protein; Parkinson's disease; Huntington's disease; Tourette's syndrome; amyotrophic lateral sclerosis; head trauma; Alzheimer's disease; alcoholism; vigilance; anxiety; muscle tension; epileptogenic activity; memory; cardiomyopathy; cancer; anglogenesis; arrhythmogenic right ventricular dysplasia; renal disease; diabetes; Epidermal growth factor like protein; leukaemia; lupus; anaemia; ulcer; haematopoietic stem and progenitor cell like protein; cirrhosis; sulfotransferase-like protein; cholangitis; hepatitis; hyperthyroidism; evelopmental disorder; Syntaxin-like protein; myxoid liposarcoma; asthma; Lambert-Eaton myasthenic syndrome; acute myeloidleukaemia; 27 BEINKAIDDAIAAIEQSETID-PMKV-----PDHADKFERHVGIVDF-----KGE-52; Gaps 9.0%; Score 96; DB 6; Length 294; 23.8%; Pred. US2002123612-A1 Homo sapiens.

The invention describes an isolated POLYX (POLY1-17) polypeptide and its variant. POLYX polypeptides (especially POLYS, POLYK and POLY7), the polymucleotides encoding them (I) and an anti-POLYX-antibody (III) are useful for treating or preventing a pathology associated with POLYX polypeptide in humans and for treating a syndrome associated with human disease. POLYX polypeptide is also useful for identifying an agent that binds to POLYX and a cell expressing POLYX is useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant

The invention describes an isolated POLYX (POIY1-17) polypeptide and its variant. POLYX polypeptides (especially POLY5, POLY6 and POLY7), the polymudleotides encoding them (1) and an anti-POLYX antibody (III) are useful for treating or preventing a pathology associated with POLYX polypeptide is also useful for identifying an agent that binds to POLYX polypeptide is also useful for identifying an agent that binds to POLYX polypeptide is also useful for identifying an agent that binds to POLYX and a cell expressing POLYX is useful for treating a pathological state in a mammal and for determining the presence or amount of POLYX in a sample. POLY1-4 (GABA receptor-like proteins) are useful for the treatment of psychiatric and medical conditions, depression, stroke, Parkinson's disease, Huntington's disease. Tourette's syndrome, amyotrophic lateral sclerosis, head trauma, alzeimer's disease, alcoholism, vigilance, anxiety, muscle tension, excepting archythmogenic activity and memory functions, cancer, aberrant archythmogenic right ventricular dysplasia. POLY5-8 (Epidermal growth archythmogenic right ventricular dysplasia. POLY5-8 (Epidermal growth argingenesis, renal disease and diabetes. POLY12 (haematopoietic stem and gromitor cell like protein) may be useful for treatment of leukaemia, luguas and anaemia. POLY13 (sulfotransferase-like proteins) may be useful for treatment of Lambart-Baton mysathenic syndrome, asthma, myxoid liposarcoma and acute mysloid leukaemia, and POLY 18 may be useful in treatment of Lambart-Baton mysathenic syndrome, asthma, myxoid liposarcoma and acute mysloid leukaemia, and POLY 18 may be useful in treatment of Lambart-Baton mysathenic syndrome, asthma, myxoid liposarcoma and acute mysloid leukaemia, and POLY 18 may be useful in treatment of Lambart Baton mysathen are useful in treatment of Lambart Pater useful in treatment of Lambart Pater useful every every every mysloid leukaemia, and POLY 18 may be useful in treatment of Lambard and acute mysloid leukaemia, and POLY every every every 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           treatment of cancers. Cells comprising () are useful for producing non-human transgenic animals which are useful for studying the function and/or activity of POLYX protein and for identifying and/or evaluating modulators of POLYX protein activity. This is the amino acid sequence of a novel human protein
                                                                   growth factor, complement receptor families for diagnosing and treating psychiatric conditions, depression, stroke, Alzheimer's and Parkinson's
polypeptides and nucleic acids which are members of epidermal
                                                                                                                                                                                                                                                                                                                                                      Claim 1; Page 38; 91pp; English.

This invention relates to novel isolated polynucleotides of human origin, particularly isolated from the human prostate. Specifically, it refers to the diagnostics and therapeutics comprising these novel human polynucleotides, and includes the derived probes, antisense olymnucleotides and antibodies thereof. The identification of these human prostate genes that can inhibit tumour growth is useful for understanding the progression and nature of complex diseases such as cancer, and hence they are important in the drug discovery process. The present invention describes these polynucleotides and encoded polypeptides as exhibiting cytostatic activity, and through gene therapy and or vaccines they can be used to modulate the immune response for the prevention or treatment of cancers, particularly of the prostate, but also for breast, lung and colon cancer. This polypeptide sequence is a human protein sequence useful for the treatment of cancer, used in an exemplification of the invention. NOTE: These sequences are not given in the specification but are provided on the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Kita D;
                                                                                                                  Human protein sequence useful for the treatment of cancer (SeqID 1496).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              polynucleotides derived from human prostate, useful for modulating une response to prevent or treat cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Leshkowitz D,

The invention is useful as vaccine and in gene therapy. The nucleic acid is useful for preparing a composition for treating or preventing e.g., tumour or inflammatory disorder. The present sequence is human syntaxinlike protein (POLY16)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      221
                                                                                                                                                                                              The invention relates to new POLYX nucleic acid useful for preparing a composition for treating or preventing tumour or inflammatory disorder. The invention is useful as vaccine and in gene therapy. The nucleic acid is useful for preparing a composition for treating or preventing e.g., tumour or inflammatory disorder. The present sequence is human syntaxin-like protein (POLY14). POLY14 gene is located on chomosome 1. Note: The present sequence is encoded by a DNA containing translational exceptions
                                                                                                                                                                                                                                                                                                                                                                                                   20

The invention relates to polymucleotides (I) encoding diagnostic and therapeutic (DITHP) polypeptides (II), which include e.g. enzymes, and proteins involved in growth and development and receptors. (I) and (II) may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate DITHP expression. For example, (I) and (II) may be used to treat diseases associated with decreased polypeptide expression by rectifying mutations or deletions in a patient's genome, that affect the activity of the DITHPs, by expressing inactive proteins or supplementing the patient's cwn production of them. (I) and (II) may be used to treat diseases, for example, cell proliferative disorder, crohn's disease, acquired immune deficiency syndrome (AIDS), lymphoma, leukaemia, autoimmune disorders, and respiratory disorders. Additionally, (I) may be used to produce the DITHPS, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) and its complementary sequences may also be used as DNA probes in diagnostic samples, and therefore which patients may be in need of restorative therapy. (II) may also be used as antigens in the production of antibodies against DITHPS antibodies and activity. The anti-DITHP antibodies and activity. The anti-DITHP antibodies and activity the anti-DITHP antibodies may also be used as diagnostic agents for detecting the anti-DITHP antibodies may also be used as diagnostic agents for detecting the presence of DITHPS in samples (e.g. by enzyme linked immunosorbant assay (ELISA)). AAU19415-AAU19425 represent human diagnostic and therapeutic coultine)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          N. The invention relates to an isolated human disease detection and treatment (MDDT) polypeptide (I) selected from a polypeptide having a sequence selected from 24s sequences (ABPSI211-ABPSI484) given in the specification, a naturally occurring polypeptide comprising a sequence having at least 90% identity to (I) or a biologically active or immunogenic fragment of (I). (I) is useful for screening a compound for effectiveness as an agonist or antagonist, for screening a compound that specifically binds (I) or modulates the activity of (I), and for preparing a polyclonal or monoclonal antibody by hybridoma technology.

Complying of (I) or modulates the activity of (I), and for complying or compound that specifically binds (I) or modulates the activity of (I), and for complying or or effectiveness in altering expression of a target polymulectide comprising or or for assessing toxicity of a test compound, or screening a compound, for effectiveness in altering expression of MDDT in a sample or for assessing toxicity of a test compound, or adjancestic test for a condition or a disease associated with the expression of MDDT in a biological sample, for detecting (I) in a sample, or generally or preventing (I), an associated with decreased or increased expression of functional MDDT. (I) are useful for disagnosing, treating or preventing disorders are selected from a cell proliferative disorder such as arteriosclerosis, cirrhosis, hepatitis, psoriasis, and cancer and an automatic athma, atherosclerosis, gout, multiple sclerosis or rhemmatoid arthritis. (II) are useful for creating whose the disorder or condition animals or transgenic crimmane, informative in animals or animals or animals to model human disorder, in sometic or animals or animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     germline gene therapy, to generate a transcript image of a tissue or cell type, for detecting differences in the chromosomal location due to translocation or inversion among normal, carrier or affected individuals and as hybridisation probes for mapping naturally occurring genomic
                                                                                                                                                                                                                                     Novel human disease detection and treatment polypeptide, useful in diagnosis, prevention or treatment of cell proliferative disorders e.g. arteriosclerosis, cirrhosis and an autoimmune/inflammatory disorder e.g.

ABP27826 standard; protein; 436 AA

```
The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 5481 sequences (51), given in the specification. The proteins have antibacterial and antihilammatory activity. (I), nucleic acids encoding (I), ABN6604-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to detect Streptococcus in a composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be morphistis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     78 IAMTEADVIVFVVSGKEGVTDADEYVSRILYKTNKFVILAVNKVDNPEMRNDIYDFYSLG 137

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by the creatment, prevention and diagnosis of medical conditions caused by concern the disorders include SaPHO Syndrome (Syndrits, acne, peranes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes proteins for example, by chargonic agents for determining P. acnes proteins of consequence data for this patent did not form part of the printed specification, but was

The invention relates to an isolated polynucleotide (ACF64435-ACF64733) encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABW64536) and to impeptides encoded by the polynucleotides. The invention additionally encompasses expression vectors and host cells comprising additionally encompasses expression vectors and host cells comprising a polypeptide of the invention; an immune response specific for a P. acnes in method for stimulating an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising P. acnes polypeptides, polymerleotides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polymicleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the

polypeptides are useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein. The polynucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polynucleotides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
